Obesity now linked to 18 cancers

Overweight and obesity during early adulthood could increase the risk of developing 18 cancers according to new research funded by Wereld Kanker Onderzoek Fonds, our network charity in the Netherlands.

The study found that the following factors related to overweight and obesity were associated with an increased risk of developing 18 cancers:

- longer length of time
- greater degree
- younger age of onset

Biologiske mekanismer, der kan forklare sammenhænge mellem overvægt og kræft?

HOW COULD OBESITY LEAD TO CANCER?

Research has identified three main ways

There are other theories too, but these are the main ideas being studied. More research is needed to understand this in more detail.

Ikke alle overvægtige har en øget risiko for tarmkræft, i EPIC

Model	Metabolic-Health-Defined Body Size Phenotype			
	Metabolic Health/BMI Definition			
	Metabolically Healthy/Normal Weight	Metabolically Healthy/Overweight	Metabolically Unhealthy/Normal Weight	Metabolically Unhealthy/Overweight
Colorectal cancer				
<i>N</i> cases/ controls	101/131	93/121	158/133	385/352
Model 1	1.00	0.95 (0.65–1.40)	1.58 (1.11–2.25)	1.47 (1.07–2.00)
Model 2	1.00	0.96 (0.65–1.42)	1.59 (1.10–2.28)	1.40 (1.01–1.94)
Model 3	—	0.69 (0.49–0.96)	—	1.00

Hvordan definerer vi metabolisk usunde?

Metabolisk syndrom:

En samling af risikofaktorer for diabetes, hjertekarsygdomme, stroke, etc.:

- **Abdominal fedme**
- **Højt blodtryk**
- **Højt fasteglucose**
- **Højt triglycerid**
- **Lavt HDL kolesterol**

3 af disse faktorer

88% af amerikanere har mindst en af disse!

Insulinresistens/hyper insulinæmi

Grundlæggende årsag til metabolisk syndrom -
kronisk forhøjede niveauer af insulin

Review of the key results from the Swedish Obese Subjects (SOS) trial – a prospective controlled intervention study of bariatric surgery

■ L. Siöström

BMI thus did not predict the effect of surgery on any of these endpoints. By contrast, insulin predicted the treatment effect with respect to mortality (P for interaction = 0.013) [35], cardiovascular events ($P < 0.001$) [37] and incidence of diabetes ($P = 0.007$) [38]

Årsager til hyperinsulinæmi:

Højt og hyppigt indtag af raffinerede kulhydrater

Manglende motion og dermed lav muskelmasse

Insulin Resistance and Cancer-Specific and All-Cause Mortality in Postmenopausal Women: The Women's Health Initiative

Kathy Pan, Rebecca A. Nelson, Jean Wactawski-Wende, Delphine J. Lee, JoAnn E. Manson, Aaron K. Aragaki, Joanne E. Mortimer, Lawrence S. Phillips, Thomas Rohan, Gloria Y. F. Ho, Nazmus Saquib, Aladdin H. Shadyab, Rami Nassir, Jinnie J. Rhee, Arti Hurria, Rowan T. Chlebowski

Results: During a median of 18.9 years of follow-up, 1820 cancer deaths and 7415 total deaths occurred. Higher HOMA-IR quartile was associated with higher cancer-specific mortality (Q4 vs Q1, HR = 1.26, 95% CI = 1.09 to 1.47; $P_{\text{trend}} = .003$) and all-cause mortality (Q4 vs Q1, HR = 1.63, 95% CI = 1.51 to 1.76; $P_{\text{trend}} < .001$). A sensitivity analysis for diabetes status did not change findings. Among women with body mass index less than 25 kg/m², higher HOMA-IR quartile was associated with higher cancer mortality (Fine and Gray, $P = .004$).

Conclusions: High insulin resistance, as measured by HOMA-IR, identifies postmenopausal women at higher risk for cancer-specific and all-cause mortality who could potentially benefit from early intervention.

Considering that non-obese people with hyperinsulinemia were at higher risk of cancer mortality than those without hyperinsulinemia, improvement of hyperinsulinemia may be an important approach for preventing cancer regardless of the presence or absence of obesity

Hvorfor forårsager hyperinsulinæmi fedme og cancer?

Cancer

Wækstfaktor

Fedme/overvægt

- Blokerer nedbrydning af fedt
- Blokerer fedtforbrænding
- Stimulerer lagring af fedt fra glucose

Genes

Food

Gut microbiome
